

SINUOUS CHEVRON EXHAUST NOZZLE

BACKGROUND OF THE INVENTION

[0001] The present invention relates generally to gas turbine engines, and, more specifically, to reduction of exhaust noise.

[0002] A typical gas turbine engine includes a compressor for pressurizing air which is mixed with fuel and ignited in a combustor for generating hot combustion gases which flow through one or more stages of turbines that power the compressor in a core engine configuration. Typically cooperating with the core engine is a low pressure compressor, such as a fan, disposed upstream of the high pressure compressor of the core engine, which is powered by a low pressure turbine disposed downstream from the high pressure turbine of the core engine.

[0003] In a typical turbofan aircraft gas turbine engine application for powering an aircraft in flight, a core exhaust nozzle is used for independently discharging the core exhaust gases inside a concentric fan exhaust nozzle which discharges the fan air therefrom for producing thrust. The separate exhausts from the core nozzle and the fan nozzle are high velocity jets typically having maximum velocity during take-off operation of the aircraft with the engine operated under relatively high power. The high velocity jets interact with each other as well as with the ambient air and produce substantial noise along the take-off path of the aircraft.

[0004] U. S. Patent 6,360,528, assigned to the present assignee, discloses an improved exhaust nozzle including a row of chevrons which promote mixing of exhaust flow for noise attenuation. The chevrons are triangular and extend from an aft end of an exhaust duct and define complementary diverging slots circumferentially or laterally therebetween. The chevrons are integral extensions of the exhaust duct, and are preferably coextensive with the outer and inner surfaces thereof.

[0005] In a typical annular exhaust duct, the inner surface thereof is circumferentially concave, and the inner surfaces of the row of chevrons are correspondingly circumferentially concave. However, by introducing an axially concave component of curvature in the radially inner surfaces of the chevrons, each chevron may therefore have a compound shallow bowl

1 therein for enhancing performance.

2 **[0006]** These shallow bowl triangular chevrons have been built, tested, and are found in
3 commercially available engines for powering aircraft in flight. In a typical turbofan engine
4 application, the chevron exhaust nozzle replaces the otherwise simple annular core exhaust
5 nozzle and effects substantial noise attenuation as the core exhaust gases mix with the fan
6 exhaust flow channeled thereover during operation.

7 **[0007]** However, noise attenuation comes with a corresponding price. In particular, the
8 chevron exhaust nozzle introduces additional pressure losses in the exhaust flows being mixed
9 thereby which decreases the overall efficiency or performance of the engine. In an aircraft
10 engine application, more fuel is required to power the aircraft than would be otherwise
11 required with a conventional circumferentially continuous exhaust nozzle having a plain
12 circular outlet.

13 **[0008]** Accordingly, it is desired to provide a chevron exhaust nozzle having improved
14 performance for reducing fuel consumption during operation.

15

16

BRIEF DESCRIPTION OF THE INVENTION

17

18 **[0009]** A gas turbine engine exhaust nozzle includes a row of laterally sinuous chevrons
19 extending from an aft end of an exhaust duct. The chevrons have radially outer and inner
20 surfaces bound by a laterally sinuous trailing edge extending between a base of the chevrons
21 adjoining the duct and an axially opposite apex of the chevrons. Each chevron has a
22 compound arcuate contour both axially and laterally, and the sinuous trailing edge of the
23 chevrons further compounds the arcuate configuration of each chevron.

24

25

BRIEF DESCRIPTION OF THE DRAWINGS

26

27 **[0010]** The invention, in accordance with preferred and exemplary embodiments, together
28 with further objects and advantages thereof, is more particularly described in the following
29 detailed description taken in conjunction with the accompanying drawings in which:

30 **[0011]** Figure 1 is an axial side view, partly in section, of an exemplary aircraft turbofan gas

1 turbine engine including fan and core exhaust nozzles having compound contour chevrons
2 therein.

3 [0012] Figure 2 is an aft-facing-forward view of the chevron core exhaust nozzle taken
4 along line 2-2 in Figure 1, and shown in isolation.

5 [0013] Figure 3 is an axial, side elevational view of the core exhaust nozzle illustrated in
6 Figure 1, and shown in isolation.

7 [0014] Figure 4 is an isometric view of a portion of the core exhaust nozzle illustrated in
8 Figure 3.

9 [0015] Figure 5 is an axial sectional view through one of the chevrons in the exhaust nozzle
10 illustrated in Figure 4, and taken along line 5-5.

11 [0016] Figure 6 is a partly sectional, aft-facing-forward view through one of the chevrons
12 illustrated in Figure 4, and taken along line 6-6.

13

14 DETAILED DESCRIPTION OF THE INVENTION

15

16 [0017] Figure 1 illustrates an aircraft turbofan gas turbine engine 10 suitably joined to a
17 wing of an aircraft 12 illustrated in part. The engine includes in serial flow communication a
18 fan 14, low pressure compressor 16, high pressure compressor 18, combustor 20, high
19 pressure turbine (HPT) 22, and low pressure turbine (LPT) 24 operatively joined together in a
20 conventional configuration.

21 [0018] The engine also includes a core nacelle or cowl 26 surrounding the core engine and
22 LPT, and a fan nacelle or cowl 28 surrounding the fan and the forward part of the core cowl
23 and spaced radially outwardly therefrom to define a bypass duct 30. A conventional
24 centerbody or plug 32 extends aft from the LPT and is spaced radially inwardly from the aft
25 end of the core cowl.

26 [0019] During operation, ambient air 34 flows into the fan 14 as well as around the fan cowl.
27 The air is pressurized by the fan and discharged through the fan duct as fan exhaust for
28 producing thrust. A portion of the air channeled past the fan is compressed in the core engine
29 and suitably mixed with fuel and ignited for generating hot combustion gases 36 which are
30 discharged from the core engine as core exhaust.

1 [0020] More specifically, the core engine includes a core exhaust nozzle 38 at the aft end
2 thereof which surrounds the center plug 32 for discharging the core exhaust gases. The core
3 nozzle 38 is axisymmetric about the axial centerline axis of the engine in the exemplary
4 embodiment illustrated in Figure 2.

5 [0021] As shown in more detail in Figure 3, the core nozzle 38 includes an annular exhaust
6 duct 40 having a plurality of circumferentially or laterally adjoining chevrons 42 arranged in a
7 row and extending aft from the aft end of the exhaust duct, and integral therewith. The
8 chevrons are circumferentially sinuous and define an outlet of the exhaust duct through which
9 the exhaust gases 36 are discharged for mixing with the fan air exhaust 34 channeled
10 downstream over the core cowl 26 during operation.

11 [0022] One of the chevrons 42 is illustrated in more detail in Figure 4 and forms an integral
12 extension of the exhaust duct. Each of the chevrons has a generally triangular configuration or
13 profile with radially outer and inner surfaces 44,46 bound or confined by a laterally sinuous
14 trailing edge 48. The fan exhaust flows over the chevron outer surfaces during operation,
15 while the core exhaust flows along the chevron inner surfaces during operation, with both
16 flows meeting and mixing along the sinuous trailing edge of the chevron row.

17 [0023] Instead of having straight triangular sides as found in the original triangular chevrons
18 disclosed in the above-identified patent, the sinuous chevrons 42 have side edges which
19 introduce curvature in the plane of the individual chevrons themselves, as identified by the
20 local radius of curvature A disposed perpendicular to the trailing edge. Each chevron extends
21 from a circumferentially wide base 50 which axially adjoins the circular aft end of the exhaust
22 duct 40, to an axially opposite aft apex 52.

23 [0024] Like the original triangular chevrons identified above, the sinuous chevrons 42 have
24 compound arcuate contours both axially between the bases and apexes of the chevrons and
25 circumferentially or laterally across the width of the chevrons. In Figure 4, the axial contour
26 of each chevron is represented by the radius of curvature B, and the lateral curvature of each
27 chevron is represented by the radius of curvature C.

28 [0025] In this way, the compound contour of each chevron 42 may be further compounded
29 by introducing additional curvature along the chevron trailing edge 48 itself, instead of having
30 that trailing edge primarily straight in the manner of the original triangular chevrons.

1 [0026] As illustrated in Figures 3 and 4, the chevron 42 are spaced laterally apart around the
2 circumference of the nozzle to define complementary, axially diverging sinuous slots 54
3 which are disposed in flow communication with the exhaust duct 40 itself. In this way, the
4 core exhaust 36 discharged from the core duct 40 can flow radially outwardly through the
5 sinuous slots 54 for mixing with the fan exhaust 34 flowing outside the chevrons.

6 [0027] As illustrated in Figure 5, the exhaust duct 40 has radially outer and inner surfaces
7 which are circumferentially circular in the exemplary embodiment, and are defined by suitable
8 values of the radius of curvature C whose origin is the axial centerline axis of the engine. The
9 chevron outer and inner surface 44,46 are preferably coextensive with the respective outer and
10 inner surfaces of the exhaust duct 40 from which they extend in a downstream aft direction.

11 [0028] Furthermore, the inner surfaces 46 of the chevrons at their bases 50 are laterally and
12 radially coextensive with the duct inner surface to provide a continuous and smooth
13 aerodynamic flowpath therewith for minimizing pressure losses. Similarly, the outer surfaces
14 of the chevrons at their bases are laterally and radially coextensive with the outer surface of
15 the exhaust duct for providing a continuous and smooth surface over which the fan exhaust is
16 discharged during operation.

17 [0029] Furthermore, the row of chevron 42 and their intervening slots 54 are preferably
18 generally laterally coextensive around the circumference thereof as illustrated in Figures 4 and
19 5 for minimizing the radially inward projection of the chevrons into the exhaust or exhaust
20 duct outlet during operation. In this way, the chevrons have shallow contours with minimal
21 radial disruption for minimizing pressure losses during operation, while correspondingly
22 attenuating exhaust noise. The chevrons and their cooperating slots are specifically designed
23 for enhancing the mixing of the high velocity core exhaust 36 with the lower velocity fan
24 exhaust 34 which correspondingly reduces the noise generated therefrom during operation.

25 [0030] The sinuous chevron trailing edges 48 illustrated in Figure 4 are preferably arcuate or
26 curved laterally around or along both sides of the chevron apexes 52 for each chevron with
27 corresponding symmetry. The trailing edges of adjacent chevrons join together in laterally
28 arcuate fillets 56 extending circumferentially between adjacent chevrons. In this way, the row
29 of chevrons are laterally contiguous at their bases with each other at the corresponding fillets
30 56 and with the circular perimeter of the exhaust duct 40 at the junction therewith.

1 [0031] As illustrated in Figure 4, the chevron trailing edges 48 are preferably sinuous from
2 the fillets 56 aft in the downstream direction toward the corresponding chevron apexes 52.
3 And, the trailing edges 48 are also sinuous from the chevron apexes 52 forward in the
4 upstream direction toward the corresponding fillets 56. In this way, the apexes and fillets
5 themselves are suitably arcuate, and the trailing edge 48 continues the smooth arcuate profiles
6 thereof along the opposite edges of each chevron between the bases and the apexes.

7 [0032] Since each chevron 42 is generally triangular and converges aft between the
8 upstream base and the downstream apex, the sinuous apex 52 is laterally convex, whereas the
9 sinuous fillet is laterally concave. The sinuous trailing edge of each chevron therefore
10 preferably includes an inflection point 58, as illustrated in Figure 4, disposed axially between
11 the apexes 52 and the fillets 56 corresponding with the chevron bases 50 which permits the
12 change in local curvature A along the side edges of the individual chevrons.

13 [0033] In the preferred embodiment illustrated in Figure 4, the chevron trailing edges 48 are
14 continuously sinuous from the fillets 56 to the apexes 52 and follow a sinusoidal curve around
15 the circumference of the nozzle. Correspondingly, the intervening slots 54 are complementary
16 sinusoidal from chevron to chevron around the circumferential extent of the nozzle.

17 [0034] The sinusoidal-form chevrons 42 illustrated in Figure 4 were built and tested and
18 compared with the original triangular form of the chevrons disclosed in the above-identified
19 patent. Comparison of the two forms of chevrons in testing indicates that a substantial
20 reduction in aerodynamic performance loss of the core nozzle may be obtained by using the
21 sinusoidal chevrons over triangular chevrons for a given amount of noise attenuation. The
22 introduction of the sinuous trailing edge in the chevrons cooperates with the compound
23 contours thereof for improving the aerodynamic mixing performance of the chevrons while
24 attenuating noise.

25 [0035] In the preferred embodiment illustrated in Figures 4 and 5, the chevron outer surface
26 44 is convex both axially and laterally, and the chevron inner surface 46 is concave both
27 axially and laterally to define a shallow compound arcuate bowl therein.

28 [0036] As shown in Figures 2 and 6, the exhaust duct 40 is circular and has a corresponding
29 value of the radius C from the engine centerline axis. And, the individual chevrons 42 are
30 preferably non-circular around the circumference of the nozzle, with each chevron having a

1 local radius of curvature D which varies along the circumferential extent of the chevron. In
2 this way, the compound contour of the individual chevrons 42 as represented by the two radii
3 of curvature B and D may be tailored or optimized for optimizing performance of the chevron
4 independently from the circular contour of the exhaust duct 40 from which the chevrons
5 extend.

6 [0037] The non-circular circumference (radius D) of the individual chevrons is a
7 conventional feature found in one embodiment of the previous triangular chevron exhaust
8 nozzle on sale in the United States for more than a year, and may be used to additional
9 advantage in the improved sinuous chevron disclosed herein.

10 [0038] As shown in Figures 4 and 5, the individual chevrons 42 are laterally contiguous
11 around the exhaust duct 40, and tangentially blend therewith, with the compound contour
12 bowls terminating at the junction of the chevrons with the circular exhaust duct.

13 [0039] The chevrons 42 illustrated in Figures 4 and 5 preferably have a constant radial
14 thickness E which matches the thickness of the exhaust duct from which they extend. The aft
15 portion of the exhaust duct and the individual chevrons extending therefrom may be formed
16 from a common ring of sheet metal having a common thin thickness thereof.

17 [0040] As shown in Figures 2 and 3, the upstream end of the exhaust duct 40 may have a
18 suitable radial flange and mounting tabs for fixedly mounting the chevron nozzle into the core
19 cowl 26. The outer surface of the core cowl blends smoothly with the outer surface of the
20 chevron nozzle joined thereto as best shown in Figure 3.

21 [0041] As also illustrated in Figure 3, the chevrons 42 preferably have equal axial lengths F
22 measured from their forward bases to their aft apexes. And, the chevron apexes 52 are
23 preferably coplanar and aligned in a single axial plane along the centerline axis of the engine.

24 [0042] Each chevron illustrated in Figure 3 has a circumferential width G which represents
25 the period of a sine wave in the preferred embodiment. The width and period of the chevrons
26 may be selected in accordance with the desired whole number thereof to be used around the
27 circumference of the intended exhaust nozzle. In the embodiment illustrated in Figure 2, there
28 are eight whole chevrons 42 spaced equidistantly apart around the circumference of the
29 exhaust nozzle in symmetry around the centerline axis of the engine.

30 [0043] In alternate embodiments, fewer or more chevrons may be used around the

1 circumference of the nozzle, and some chevrons may be eliminated directly below the aircraft
2 pylon which may interrupt the circumferential continuity of the external fan exhaust flow.

3 [0044] As shown in Figures 1-3, the sinuous chevrons 42 are introduced in the core exhaust
4 nozzle 38 which includes the center plug 32 converging aft inside the exhaust duct 40. This
5 external center plug 32 terminates aft or downstream from the chevron apexes 52 in a manner
6 similar to the original triangular chevron configuration. Alternatively, a conventional internal
7 center plug may be used with the sinuous chevrons.

8 [0045] Also like the previous triangular chevron nozzles, the sinuous chevrons 42 may be
9 introduced into a corresponding fan exhaust nozzle 60 as illustrated in Figure 1. The sinuous
10 chevrons 42 in the fan nozzle embodiment may be substantially identical to those used in the
11 core nozzle embodiment, except for different size and configuration specific to the larger fan
12 exhaust nozzle in which they are incorporated. In either embodiment, the sinuous chevrons
13 may now be additionally tailored or optimized for the introduction of smoothly curved trailing
14 edges between the bases and apexes thereof, either completely or in most part as the particular
15 design merits.

16 [0046] In yet another configuration, the fan nacelle may extend aft past the core nozzle to a
17 common exhaust outlet, with a long fan bypass duct terminating upstream therefrom. The
18 sinuous chevrons may be incorporated in the core nozzle as an internal mixer for mixing the
19 core exhaust and the fan bypass air.

20 [0047] The introduction of smoothly changing contour along the trailing edges of the
21 chevrons cooperates with the compound shallow contours thereof for introducing an
22 additional design variable for decreasing chevron aerodynamic performance loss while
23 attenuating exhaust noise.

24 [0048] While there have been described herein what are considered to be preferred and
25 exemplary embodiments of the present invention, other modifications of the invention shall be
26 apparent to those skilled in the art from the teachings herein, and it is, therefore, desired to be
27 secured in the appended claims all such modifications as fall within the true spirit and scope of
28 the invention.

29 [0049] Accordingly, what is desired to be secured by Letters Patent of the United States is
30 the invention as defined and differentiated in the following claims in which we claim:
